

NLP Project 1: Customer Review Analysis

Problem Statement

An online shopping company receives thousands of customer reviews every day across multiple product categories. These reviews contain valuable information about customer satisfaction, product quality, delivery experience, and service issues. However, manually reading and analyzing every review is difficult and time-consuming for the management team. The company wants to build an NLP-based system that can automatically process customer reviews, identify positive and negative opinions, detect frequently mentioned complaints, and provide meaningful business insights to improve customer experience and decision-making.

Tasks

1. Collect customer review data.
2. Clean and preprocess review text.
3. Perform sentiment analysis.
4. Identify common keywords and complaints.
5. Generate business insights.
