

NLP Project 3: Movie Review Classification

Problem Statement

A movie streaming platform receives large numbers of audience reviews for newly released movies and web series. These reviews contain viewer opinions about acting, storyline, music, direction, and overall entertainment value. The platform wants to understand audience reactions and classify reviews into positive, negative, or neutral categories to measure movie popularity and improve content recommendations. Manual review analysis is not practical due to the huge amount of text data generated daily.

Tasks

1. Collect movie review data.
2. Preprocess review text.
3. Build a sentiment classification model.
4. Analyze audience opinions.
5. Visualize sentiment results.
