

NLP Project 2: Restaurant Feedback Analysis

Problem Statement

A restaurant chain receives customer feedback through food delivery applications, online review platforms, and feedback forms. Customers often share opinions about food taste, delivery speed, packaging, pricing, and customer service. Since the feedback volume is increasing rapidly, restaurant managers find it difficult to manually analyze customer opinions and identify areas that need improvement. The organization wants to use NLP techniques to analyze customer feedback, understand customer satisfaction levels, and identify common issues that impact the dining experience.

Tasks

1. Collect restaurant review data.
2. Preprocess customer feedback text.
3. Perform sentiment classification.
4. Identify common service issues.
5. Prepare a feedback analysis report.
