

NLP Project 6: News Article Classification

Problem Statement

A news website publishes articles from different domains such as sports, politics, technology, entertainment, and business. As the number of articles increases daily, manually organizing them into categories becomes difficult and time-consuming. The company wants to implement an NLP-based article classification system that can automatically categorize news articles accurately and improve content organization for readers.

Tasks

1. Collect news article dataset.
2. Preprocess article text.
3. Build text classification model.
4. Categorize articles automatically.
5. Evaluate model performance.
