

NLP Project 4: Email Spam Detection

Problem Statement

An organization receives a large number of emails every day, including important business messages as well as unwanted spam emails containing advertisements, fake offers, and malicious content. Employees often waste time manually filtering irrelevant emails, which affects productivity and communication efficiency. The organization wants to develop an NLP-based spam detection system that can automatically classify emails as spam or non-spam and help users manage email communication more effectively.

Tasks

1. Collect email dataset.
2. Preprocess email text.
3. Build spam classification model.
4. Evaluate classification accuracy.
5. Generate spam analysis report.
